

WATER CONSERVATION ESSAY

Water is essential for life on our planet. It is required for many things including the growth of food, maintaining ourselves clean, power generation, control fire, and most importantly to stay alive. Water is a part of our daily life and we are heavily dependent on it.

The conservation of water is very important and necessary to have a healthy and long-lasting life. Conserving the water is not difficult, it saves money, and it is beneficial to our future. We do not know if there is enough water for a more crowded world in the future. We must learn about the importance of water, and conserve the water to prevent future problems.

Water conservation refers to the reduction in the usage of water. It can also include the recycling of water for purposes like irrigation, cleaning, and even treatment for later use. That is the reason why we need to conserve our water in this case the Rio Grande water; it may be helpful for our future and might be used for other purposes.

Small changes such as not leaving the faucet running while brushing your teeth, or checking for leaks more often can make a big difference. All of these are very important.

Nowadays we use much more water than we ever did. Every human being uses hundreds of gallons of water per day. This makes a state's population use millions of gallons of water a day. All this consumption of water comes to a high cost, sometimes paying hundreds of dollars per month

Reducing the water you use will save you money. Even though water makes up about seventy percent of the earth's surface, only a small percentage of that water is good for human use. Reducing the amount of water used will help you economically and benefit you and the coming generation in the future as well.

Water is the first necessity for survival on the earth. As we can see, the world's population is growing at a fast rate. We must take precautions for a sustainable fortune wherein people are well-equipped with at least the basic necessity of life i.e. water.

According to the survey by the National Crime Records Bureau recently, it has been recorded that around 16,632 farmers (2,369 women) finished their lives through suicide, however, 14.4% of cases were because of drought.

So, we can say that water scarcity is also the reason for illiteracy, suicide, fights, and other social issues in India and other developing countries. In such regions of water scarcity, the children of the new generation are not achieving their basic right to education and the right to live happily

Therefore, as responsible citizens of India, we should make ourselves aware of all the problems of water scarcity so that we all may take a pledge and join hands together for water conservation. There is a true saying that a small effort of everyone can give a big result just like many drops of water form a huge water body like a pond, river, and sea.

We do not need to make extra efforts for water conservation, we only need to bring some positive changes in our daily activities, closing the tap after everyone uses tightly, use of bucket and mug while washing anything, or bathing instead of using a shower or pipe. A little effort from the end of millions of people can give a big and positive result towards the Save Water campaign.
